

The research area that interests me the most is condensed matter physics. I am particularly passionate about electronic devices and 2D materials. During my undergraduate and master's studies, I worked with 2D materials, and the lab I was part of also conducted research on organic photovoltaics (OPVs) and gas sensors. Additionally, I gained experience with lithium-ion batteries while working at the SENAI Institute for Innovation in Brazil. While I am deeply interested in these areas, I am also captivated by research involving other electronic devices, such as light-emitting diodes (LEDs) and transistors, which hold great potential for impactful and innovative studies.

The research projects that I'm most interested in are: "Towards Pb-free perovskites for solar energy applications" from Dr. Julie Euvrad, "Interface engineering for high performance energy storage applications", "Single-Component Organic Photovoltaics and Photodetectors" and "2D/3D Perovskites for Efficient Solar Cells" from Prof. Ji-Seon Kim, and "Device physics of single-component organic solar cells" from Prof. Jenny Nelson.
